# Wholeness Statement

---

HTML forms generate and process user input. Users complete HTML forms using different data widgets , and the server will process the information submitted from the forms.

Forms are a communication mechanism, connecting a model with a remote view of the model and in this case providing input to the model. Forms collect and send information to the server like our sensory systems collect and send perceptions to our awareness.

# Main Point Preview

---

An HTML form allows the user to send data (input parameters) to the server. Forms are created with the <form> tag, and can be submitted with either an HTTP GET or POST method.

HTTP is a protocol for contacting the server and thereby gaining access to all the resources on the server. Similarly, the TM technique is a protocol for contacting the Self and thereby gaining access to all the resources of pure consciousness.

# Query strings and parameters

---

- **Query string:** a set of parameters passed from a browser to a web server. Often passed by placing name/value pairs at the end of a URL.
- Below, parameter **username** has value “anna”, and **sid** has value “12345”

<http://mum.edu/login.jsp?username=anna&sid=12345>

<http://www.google.com/search?q=CSS>

<https://www.google.com/?q=HTML+Form>

# Request Command

---

- 3 ways to send a request from a browser tab to the server:
  - Type url (GET)
  - Form (GET, POST.. etc)
  - XHR Request (GET, POST.. etc)
- Request methods:
  - GET: only has header (parameter are sent in the header, NO body)
  - POST: has header and body (parameters are sent in the body)

# HTTP **GET** vs. **POST** requests

---

- **GET** : asks a server for a page or data
  - if the request has parameters, they are sent in the URL as a query string (request header)
  - URLs cannot contain special characters without encoding
  - private data in a URL can be seen or modified by users
- **POST** : submits data to a web server (to be saved in DB or file or updates state in server application)
  - parameters are embedded in the HTTP request body, not the URL

# HTML forms

Form: group of UI controls that accepts information from the user and sends the information to a web server

- The information is sent to the server as a query string

The image shows a collection of HTML form controls. At the top is a single-line text input field. Below it is a multi-line text area with the placeholder text "Add Comments Here". Underneath the text area are four radio buttons labeled "Value 1", "Value 2", "Value 3", and "Value 4", with "Value 1" selected. Below the radio buttons are five checkboxes labeled "Value 1", "Value 2", "Value 3", "Value 4", and "Value 5", with "Value 1" and "Value 2" checked. At the bottom are two buttons: "Submit" and "Reset".

# HTML form: `<form>`

---

The `<form>` tag is used to create an HTML form for user input.

The `<form>` element can contain one or more of the following form elements:

`<input>`, `<textarea>`, `<button>`, `<select>`, `<option>`, `<optgroup>`, `<fieldset>`,  
`<label>`, `<datalist>`, `<output>`

```
<form action="sales.html" method="get" novalidate autocomplete="on">  
    Form controls  
</form>
```

## Form Attributes

- **action** destination URL
- **method** get, post
- **novalidate** (HTML5) specifies that the form should not be validated when submitted
- **autocomplete** (HTML5) on, off

# Form Example

---

```
<form action="http://www.google.com/search">
  <div> Let's search Google
    <input name="q" />
    <input type="submit" />
  </div>
</form>
```

Let's search Google

## Main Point

---

An HTML form allows the user to send data (input parameters) to the server. Forms are created with the <form> tag, and can be submitted with either an HTTP GET or POST method.

*HTTP is a protocol for contacting the server and thereby gaining access to all the resources on the server. Similarly, the TM technique is a protocol for contacting the Self and thereby gaining access to all the resources of pure consciousness.*

## Main Point Preview

---

HTML provides many different types of input widgets, including text fields, text areas, check boxes, radio buttons, and dropdown lists, this is also an area HTML 5 is expanding to make form filling more efficient and effortless.

*Nature supports the growth of things that are efficient. Do less and accomplish more.*

# Form controls: <input>

---

```
<input type="text" name="q" value="Colbert Report" />
```

```
<input type="submit" value="Booyah!" />
```

- `input` element is used to create many UI controls
  - an inline element that **MUST** be self-closed
- `name` attribute specifies name/key of query parameter to pass to server
- `type` **can be** button, checkbox, file, hidden, password, radio, reset, submit, text, ...
- `value` attribute specifies control's initial text

# Text fields: <input>

```
<input type="text" name="username" size="10" maxlength="8" />
```

```
<input type="text" name="password" size="8" />
```

Attribute		Value(s)	Description
value		text	Initial text to appear in text box
size		integer	Visible length of text box, in characters
maxlength		integer	Maximum number of chars that may be typed into text box
autocomplete		on, off	Whether to offer suggestions of text to auto-complete the field
autofocus		autofocus	Makes control initially receive keyboard focus
novalidate		novalidate	Indicates browser should not check value before submitting
placeholder		text	A hint or example of what the user should type;
pattern		regular expr.	A regular expression indicating what input is valid
required		required	Whether browser should display an error if blank

# Checkboxes

- yes/no choices that can be checked and unchecked (**inline**)
  - none, 1, or many checkboxes can be checked at same time
  - Use the **checked** attribute in HTML to initially check the box

```
<input type="checkbox" name="condiment1" /> Lettuce
```

```
<input type="checkbox" name="condiment2" checked /> Tomato
```

```
<input type="checkbox" name="condiment3" checked /> Pickles
```

☐ Lettuce ☒ Tomato ☒ Pickles

# Radio buttons

- Sets of mutually exclusive choices (**inline**)
  - Grouped by **name** attribute (only one can be checked at a time)
  - Must specify a **value** for each one or else it will be sent as value **on**

```
<input type="radio" name="cc" value="visa" checked /> Visa
```

```
<input type="radio" name="cc" value="mastercard" /> MasterCard
```

```
<input type="radio" name="cc" value="amex" /> American Express
```

☒ Visa ☐ MasterCard ☐ American Express

## <textarea>

---

- The <**textarea**> tag defines a multi-line text input control. (inline)
- holds unlimited number of characters
- text renders in a fixed-width font (usually Courier).
- size specified by **cols** and **rows** attributes,
  - Or better, through CSS **height** and **width** properties.
  - `textarea { width: 300px; height: 200px }`

```
<textarea rows="4" cols="20">
```

**Type your comments here.**

```
</textarea>
```

## Text labels: <label>

- Associates nearby text with control, so you can **click text to activate control**
- Can be used with **checkboxes** or **radio** buttons
- **label** element can be targeted by CSS style rules

```
<label> <input type="radio" name="cc" value="visa" checked="checked" /> Visa</label>
```

```
<label> <input type="radio" name="cc" value="mastercard" /> MasterCard</label>
```

```
<label> <input type="radio" name="cc" value="amex" /> American Express</label>
```

☒ Visa ☐ MasterCard ☐ American Express

## Drop-down list `<select>` and `<option>`

- Menus of choices that collapse and expand (inline)
  - **option** element represents each choice
  - **select** optional attributes: **disabled**, **multiple**, **size**
  - optional **selected** attribute sets which one is initially chosen

```
<select name="favoritecharacter">  
  <option>Jerry</option>  
  <option>George</option>  
  <option selected>Kramer</option>  
  <option>Elaine</option>  
</select>
```

# Multiple <select>

- optional **multiple** attribute allows selecting multiple items with shift- or ctrl- click
- **option** tags can be set to be initially **selected**

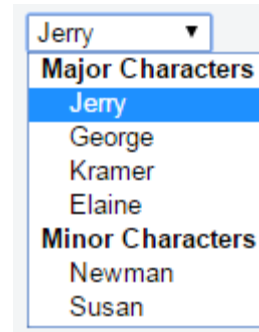

```
<select name="favoritecharacter" size="3" multiple>
  <option>Jerry</option>
  <option>George</option>
  <option>Kramer</option>
  <option>Elaine</option>
  <option selected>Newman</option>
</select>
```

# Option groups: <optgroup>

```
<select name="favoritecharacter">
  <optgroup label="Major Characters">
    <option>Jerry</option>
    <option>George</option>
    <option>Kramer</option>
    <option>Elaine</option>
  </optgroup>
  <optgroup label="Minor Characters">
    <option>Newman</option>
    <option>Susan</option>
  </optgroup>
</select>
```

# Reset and Submit buttons

---

- When we click **reset** button, it returns all form controls to their initial values
- When we click **submit** buttons, it sends all data with the specified **method** (Get/Post) to the **action** page in the form
- Specify custom text on the button by setting its **value** attribute

```
<input type="reset" />
```

```
<input type="submit" />
```

# Hidden input parameters

- An invisible parameter that is still passed to the server when form is submitted, it's useful for passing on additional state that isn't modified by the user

```
<input type="text" name="username" /> Name  
<br />  
<input type="text" name="sid" /> SID  
<br />  
<input type="hidden" name="school" value="MUM" />  
<input type="hidden" name="year" value="2048" />
```

	Name
	SID

# Grouping `<fieldset>`, `<legend>`

- Groups of input fields with optional caption (legend)

```
<fieldset>
  <legend>Credit cards:</legend>
  <input type="radio" name="cc" value="visa" checked="checked" /> Visa
  <input type="radio" name="cc" value="mastercard" /> MasterCard
  <input type="radio" name="cc" value="amex" /> American Express
</fieldset>
```

# New Form Controls in HTML5

Input type	Description
color	A color from a palette of available choices
range	A slider for selecting values in a given range
date	A date such as August 29, 2016
time	A time of day such as 11:15 PM
datetime	A date and time such as 11:15 PM, August 29, 2016
month	A month of a particular year, such as August, 2016
week	A week of a particular year, such as August 35, 2016

# Styling forms - attribute selector

- Because most input elements are created using input tag, we can target groups of elements using this CSS selector:

```
element[attribute="value"] {  
  property: value;  
  property: value;  
  ... property: value;  
}  
  
input[type="text"] {  
  background-color: yellow;  
  font-weight: bold;  
}
```

CS472

## Main Point

---

HTML provides many different types of input widgets, including text fields, text areas, check boxes, radio buttons, and dropdown lists, this is also an area HTML 5 is expanding to make form filling more efficient and effortless.

*Nature supports the growth of things that are efficient. Do less and accomplish more.*

# Pattern and regular expressions

The **pattern** attribute specifies a regular expression that the `<input>` element's value is checked against. The **pattern** uses the ECMAScript (i.e. JavaScript) flavor of regex.

Note: The **pattern** attribute works with the following input types: **text**, **date**, **search**, **url**, **tel**, **email**, and **password**.

Tip: Use the global **title** attribute to describe the pattern to help the user.

```
<form action="demo_form.jsp">
```

Country code:

```
<input type="text" name="country_code" pattern="[A-Za-z]{3}" title=" Three letter country code">
```

```
<input type="submit">
```

```
</form>
```

Country code: 123 Submit

! Please match the requested format.  
Three letter country code

# Regular expressions

---

`^[a-zA-Z_\-]+@([a-zA-Z_\-]+\.)+[a-zA-Z]{2,4}$`

- Test whether a string matches the expression's pattern
- powerful but tough to read
  - (the above regular expression matches email addresses)
- used in all languages:
  - Java, PHP ,JavaScript, HTML, C#, and other languages
- Many IDEs allow regexes in search/replace

# Basic regular expressions

---

The simplest regexes simply matches any string that contains that text.

**abc**

above regular expression matches any string containing "abc":

- YES: "abc", "abcdef", "defabc", " .=.abc.=.", ...
- NO: " ABC" , " fedcba", "ab c", "PHP", ...
- Note that html5 has **implicit** anchors **^** and **\$**, so abc is really ^abc\$
- Regular expressions are **case-sensitive** by default.

# Wildcards

---

A dot `.` matches exactly **one-character** except a `\n` line break

`.oo.y` matches "Doocy", "goofy", "LooNy", ...

## Special characters: |, (), \

---

| means OR

**abc|def|g** matches "abc", "def", or "g"

() are for grouping

**(Homer|Marge) Simpson**

matches "Homer Simpson" or "Marge Simpson"

\ escapes a special character

many characters must be escaped to match them literally: / \ \$ . [ ] ( ) ^ \* + ?

**<br\/>** matches lines containing <br /> tags

## Quantifiers: \*, +, ?

---

**\*** means 0 or more occurrences

**abc\*** matches "ab", "abc", "abcc", "abccc", ...

**a(bc)\*** matches "a", "abc", "abcbc", "abcbcbc", ...

**a.\*a** matches "aa", "aba", "a8qa", "a!?xyz\_\_9a", ...

**+** means 1 or more occurrences

**a(bc)+** matches "abc", "abcbc", "abcbcbc", ...

**Goo+gle** matches "Google", "Goooogle", "Goooooogle", ...

**?** means 0 or 1 occurrences

**a(bc)?** matches "a" or "abc"

## More quantifiers: {min,max}

---

**{min,max}** means between min and max occurrences (inclusive)

**a(bc){2,4}** matches "abcbc", "abcbcbc", or "abcbcbcbc"

**min** or **max** may be omitted to specify any number

**{2,}** means 2 or more

**{3}** means exactly 3

## Anchors: ^ and \$

---

^ represents the beginning of the string or line;

\$ represents the end

**Jess** matches all strings that contain Jess;

**^Jess** matches all strings that start with Jess;

**Jess\$** matches all strings that end with Jess;

**^Jess\$** matches the exact string "Jess" only

**^Mart.\*Stepp\$** matches "MartStepp", "Marty Stepp", "Martin D Stepp", ... but NOT "Marty Stepp stinks" or "I H8 Martin Stepp"

The html5 spec states that ^ and \$ are implicit

## Character sets: []

---

**[]** group characters into a character set, will match any **single character** from the set

**[bcd]art** matches strings containing "bart", "cart", and "dart"

equivalent to **(b|c|d)art** but shorter

inside [], many of the modifier keys act as normal characters **what[!\*?]\***  
matches "what", "what!", "what?\*!\*!", "what??!", ...

What regular expression matches DNA (strings of A, C, G, or T)? **[ACGT]+**

## Character ranges: [start-end]

---

inside a character set, specify a range of characters with -

**[a-z]** matches any lowercase letter

**[a-zA-Z0-9]** matches any lower- or uppercase letter or digit

an initial **^** inside a character set negates it

**[^abcd]** matches any character other than a, b, c, or d

inside a character set, - must be escaped to be matched

**[+\-]?[0-9]+** matches an optional + or -, followed by at least one digit

What regular expression matches letter grades such as A, B+, or D- ?

**[ABCDF][+\-]?**

# Escape sequences

---

Special escape sequence character sets:

- \d** matches any digit (same as [0-9])
- \D** any non-digit ([^0-9])
- \w** matches any word character (same as [a-zA-Z\_0-9])
- \W** any non-word char
- \s** matches any whitespace character ( , \t, \n, etc.)
- \S** any non-whitespace

What regular expression matches dollar amounts of at least \$100.00 ?

**\\$[1-9]\d{2,}\.\d{2}**

# CONNECTING THE PARTS OF KNOWLEDGE WITH THE WHOLENESS OF KNOWLEDGE

## HTML Forms: Connecting with the Source

1. Forms let us submit data to the web server, which can then generate a custom response based on server-side information.
  2. GET requests are intended to only retrieve information and should be idempotent. POST requests are intended to submit data and not request a direct response.
- 
3. **Transcendental consciousness** is the experience of the source of thought.
  4. **Impulses within the Transcendental field:** inputs and perceptions are appreciated in their full value at the quiet levels of the mind.
  5. **Wholeness moving within itself:** In Unity Consciousness one appreciates the full value of all inputs and perceptions. Everything is appreciated as some expression of Totality.

# Advanced: Lookaround

---

## Positive lookahead **(?=A) B**

Once a group starts with **?=** it means positive lookahead. Find expression A first, if found then expression B follows.

## Negative lookahead **(?!A) B**

Once a group starts with **?!**  it means negative lookahead.

First check if expression A is not found, then check if expression B follows.

# Example - email

- An `<input>` element with `type="email"` that must be in the following order: characters@characters.domain

(characters followed by an @ sign, followed by more characters, and then a "." and then 2 or 3 letters)

```
<form action="demo_form.jsp">
```

**E-mail:**

```
<input type="email" name="email" pattern="[a-z0-9._+\-]+@[a-z0-9.\-]+\.[a-z]{2,3}">
```

```
<input type="submit">
```

```
</form>
```

E-mail:

! Please include an '@' in the email address. 'fdfd' is missing an '@'.

# Examples - password

- An `<input>` element with `type="password"` that must contain 8 or more characters that are of at least one number, and one uppercase and lowercase letter:

```
<form action="demo_form.jsp">
```

**Password:**

```
<input type="password" name="pw" pattern="(?=\d+)(?=[a-z]*)(?=[A-Z]*).{8,}" title="Must contain at least one number and one uppercase and lowercase letter, and at least 8 or more characters">
```

```
<input type="submit">
```

```
</form>
```

The screenshot shows a web form with a label "Password:" followed by a text input field containing five dots. To the right of the input field is a "Submit" button. A yellow warning icon is visible next to the input field, and a tooltip message is displayed below it. The message reads: "Please match the requested format. Must contain at least one number and one uppercase and lowercase letter, and at least 8 or more characters".

# Example - Search

- An <input> element with type="search" that CANNOT contain the following characters: ' or “

```
<form action="demo_form.jsp">
```

```
  Search: <!-- x27 is a single quote and \x22 is a  
double quote -->
```

```
  <input type="search" name="search"  
pattern="^[^\x27\x22]+" title="cannot contain quote  
characters">
```

```
  <input type="submit">  
</form>
```

Search:

! Please match the requested format.  
Invalid input
